

CardioSox

The most comfortable and driest socks ever worn!

HOW DO THEY WORK?

TECHNOLOGY: ChitoCotton uses Chitosan in the fabric to help reduce odor. Patented Aerocool Technology incorporates small capillary tubes to draw away moisture and help keep feet dry. Special absorbent fiber allows the feet to breathe while preventing socks from breeding bacteria. Far-Infrared Technolor aids in temperature regulation. Sports cushioning features a thick, padded layer that surrounds the entire foot, for protection and comfort A built-in arch support can help prevent fatigue.

FABRIC: 46% ChitoCotton yarn, 31% polyceramic-reflective fiber, 15% Aerocool poly yarn, 7% Spandex and other fibers, 1% Nylon.

The AeroCool fabric with its double face - incorporates a soft inner layer which has been treated to encourage the wicking of moisture plus it incorporates a mesh knit construction to assist air flow over the skin surface while the wearer is in motion. These two factors combined aid the wicking of moisture to the outer fabric layer from where the moisture evaporates. The outer layer is constructed to provide both strength and a smooth surface for that extra edge in performance.

The moisture dispersal aids the body environment system to work more effectively by keeping the skin cool when physical activity is high and yet warm when activity ceases. As a result of the skin being drier this minimizes the rapid cool down effect or chill factor.
